

MUSCLE WALL®

FLOOD • CONTAINMENT • STORMWATER

Time is money on any job site so a primary and secondary containment solution that can be set up and taken down in as little time as possible is crucial. The light weight of each wall, coupled with the intuitive design allows Muscle Wall to be deployed and removed with only a small team of workers and without the aid of heavy equipment very quickly. A 2-foot secondary containment large enough to house a standard frac tank can be deployed in just 30 minutes.

THE NUMBERS DON'T LIE

During one of our recent primary containment deployments in Hobbs, New Mexico two 25,000bbl and one 18,000bbl containments were constructed with 4-foot Muscle Wall.

Deployment times for Muscle Wall systems:

- 200ft x 200ft (25,000bbl) - 7 hours
- 200ft x 170ft (18,000bbl) - 5 hours
- 200ft x 200ft (25,000bbl) - 3.5 hours

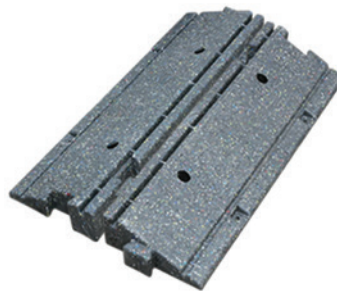

MUSCLE WALL vs EARTHEN SOLUTIONS

For years the method of choice for secondary containment has been earthen solutions. These solutions are expensive, require the use of heavy equipment, and present significant environmental concerns. Muscle Wall was engineered and designed to provide superior secondary containment without the common issues that are prevalent with earthen solutions.

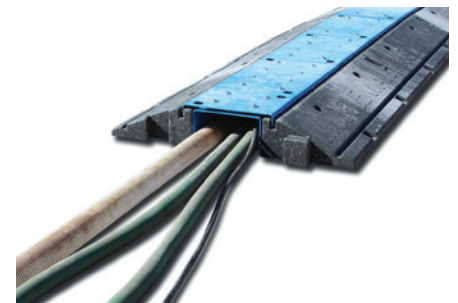

MODULAR CONTAINMENT SYSTEM

By having multiple 6-foot wide sections Muscle Wall can be configured to meet the needs of our customers. The corner units allow for a 90-degree turn and the ability for square containments. The 22-degree range of motion at each joint allow for circular or curved containments as well as the ability to bend or curve around terrain or equipment.

DRIVE OVER CONTAINMENT

6-inch Muscle Wall has the ability to connect to the back of other 6-inch Muscle Wall to create a ramp that can be driven over by the heaviest equipment we've been able to find. This can greatly simplify your secondary containment system as well as be employed for creating quick and easy equipment spray-off zones.

PROTECT THE LIFELINE OF YOUR SITE

The Muscle Wall drive-over system offers incredible protection for the lifeline of oil & gas and construction sites: data wires, hoses, and pipes. The system can be transported on and off the site in the back of a pickup truck, set up by as little as one person, and has the strength capacity to withstand the weight of anything on the road.
